Evaluator answer key

Keep this file out of the document notebook

Upload only the operations report. Ask the questions below **one at a time**. This is a controlled evaluation of a synthetic report; correctness here does not establish general model accuracy.

1. Compare production efficiency between Q2 and Q4.

72% to 84%; +12 percentage points; +16.67% relative. Cite report p.1, section 1.2 / Table 1.

2. How much did good output and downtime change?

Output: +3,000 units (+16.67%). Downtime: -20 hours (50% decrease). Cite p.1, Table 1.

3. Read Figure 1: compare first-pass yield in Q2 and Q4.

90% to 96%; +6 percentage points; +6.67% relative. Cite p.2, section 2.1 / Figure 1. Values must be read visually.

4. Rank the three reported drivers of the efficiency change.

Maintenance +6 pp, training +4 pp, materials +2 pp. These are management estimates, not proven causal effects. Cite p.3, section 3.1.

5. Recalculate Q4 efficiency from units, hours and rate.

21,000 / (500 x 50) x 100 = 84%. Do not subtract downtime twice. Cite p.1, sections 1.1 and 1.2.

6. Did the higher maintenance spend improve net profit?

Cannot determine: prices, labor and energy costs are absent. Spend rose USD 6,000 (50%), but profit/ROI are unsupported. Cite p.3, section 3.2; p.1 for spend.

7. Compare changes in efficiency and first-pass yield.

Efficiency +12 pp; yield +6 pp. They are distinct metrics. Cite p.1, Table 1 and p.2, Figure 1.

8. How many units needed rework in Q4?

Cannot determine: inspected-unit total is absent. Good output alone is insufficient. Cite p.2, section 2.2.
